1 (bases 1 to 15270)
Whitehead, S.S., Hanley, K.A., Blaney, J.E. Jr., Gilmore, L.E.,
Elkins, W.R. and Murphy, B.R.
Substitution of the structural genes of dengue virus type 4 with
those of type 2 results in chimeric vaccine candidates which are
attenuated for mosquitoes, mice, and rhesus monkeys
Vaccine 21 (27-28), 4307-4316 (2003)

Savilahti H, Tieaho V; WPI; 2003-845329/78. New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by a transposase useful for producing deletion derivatives of polypeptide.

Claim 7; Page 31-32; Opp; English.

The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposition reaction in the presence of a transposon containing a genetically engineered translation stop signal

                                                                                                                                                           New tetravalent vaccine containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4, useful for preventing of disease in humans caused by dengue virus, or for inducing immune
                                                                                                                                                                                                                                                                                                                                                                           tetravalent and containing a common nucleotide deletion in the 3' untravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccinated since each component of the vaccine possesses the same deletal attenuating deletion mutation. The vaccine possesses to induce humoral and cellular responses against al of the (non-)structural proteins present in each dengue virus serotype. The present sequence is that of the DEN3 cDNA plasmid P3 which is related to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11246 idricaaraktroaraktronitritroararitaridaadoaritaroaddoiraridr

This invention relates to a novel immunogenic composition being tetravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or immunostimulant activity or as a vaccine. The tetravalent vaccine is unseful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which unique since they contain a common shared attenuating mutation which subject to be vaccinated since ach component of the vaccine possesses the same delta30 attenuating deletion mutation. The vaccine also is able to to induce humanal and cellular responses against al of the (non-sequence is that of the DENZ CDNA plasmid P2 which is related to the

This invention relates to a novel bacterial host cell comprising at least two copies of an amplification unit in its genome, where two or more amplified chromsomal copies of the gene of interest are produced. The amplification unit comprises at least one copy of a gene of interest and amplification unit comprises at least one copy of a gene of interest and expressible conditionally essential gene, where the conditionally components or transforms a heterologous promoter having an activity substantially lower than the endogenous promoter of the conditionally essential gene, and where the conditionally component is either promoter of the conditionally essential gene, and where the conditionally component of essential gene. The conditional would render the cell auxotrophic for at least one specific substance or unable to utilize one or more specific sole carbon source. The bacterial host cell is useful for producing of a protein having several copies of a gene of interest stably chromosomally integrated, without leaving antibiotic resistance marker genes in the strains. The present sequence is that of a plasmid DNA sequence which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5780

The present sequence represents a Tn7 donor plasmid pEM delta. Transposon Tn7 encodes an ATP-utilising regulatory protein that contains a mutation that allows efficient and simple insertion of, and reduced target site specificity of, a transposable element derived from the transposon. The ATP-regulatory protein and compositions are used for the efficient, nonspecific and simple insertion of a transposon or transposable element into a DNA segment. This is useful in DNA sequencing, for genetic analysis by insertional mutagenesis, or for alteration of gene expression

by insertion of a desired sequence

encoding mutant ATP using proteins for insertion - which irandom, with reduced site specificity; for DNA sequencing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a mutant ThSC transposition regulatory protein. This mutant protein activates a transposase in the absence of ThSD or ThSE, which directs intermolecular transposition of a transposable element and discriminates between immune and nonimmune targets, in a manner which is characterised by reduced target site selectivity. It may be used in DNA sequencing methods, for genetic analysis by insertional mutagenesis and alteration of gene expression by insertion of a given genetic sequence. The present DNA sequence is transposon donor plasmid pEM delta, a pBR plasmid containing a kanamycin mTn7 element. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mutant TnsC transposition regulatory protein for use in DNA sequencing, for genetic analysis, and alteration of gene expression by insertion of given genetic sequence, comprises an alanine to valine substitution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3692
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5250
kanamycin gene with SalI sites at the junctions. The backbone is pTRC99 (Pharmacia). Transposon Tn7 encodes an ATP-utilising regulatory protein that contains a mutation that allows efficient and simple insertion of, and reduced target site specificity of, a transposable element derived from the transposon. The ATP-regulatory protein and compositions are used for the efficient, non-specific and simple insertion of a transposon or transposable element into a DNA segment. This is useful in DNA sequencing, for genetic analysis by insertional mutagenesis, or for alteration of gene expression by insertion of a desired sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TICAACAAAGCCGCCGTCCAAGTCAGCGTAATGCTCTGCCAGTGTTACAACCAATT 3632
                                                                                                                                                                                                                                             The invention relates to a mutant ThgC transposition regulatory protein. This mutant protein activates a transposase in the absence of ThsD or ThsE, which directs intermolecular transposition of a transposable element and discriminates between immune and nonimmune targets, in a manner which is characterised by reduced target site selectivity. It may be used in DNA sequencing methods, for genetic analysis by insertional mutagenesis and alteration of gene expression by insertion of a given penetic sequence. The present DNA sequence is transposen donor plasmid pEM delta R.adj to 1, used in the exemplification of the invention. This plasmid comprises a 1625 bp mini-Th7 element:199 bp of Th7R and 166 bp of Th7L flanking a Kan gene with Sall at the junctions
                                                                                                                                                                                             ď
                                                                                                                                                                                for use in DNA sequencing, expression by insertion of to valine substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TGAGAGCTTTGTTGTAGGTGGACCAGTTGGTGATTTTGAACTTTTGCTTTGCCACGGAAC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5747
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a transposon encoding an ATP-utilising regulatory protein containing a mutation that allows efficient and simple insertion of and reduced target sitts specificity on the transposon. The invention is used in DNA sequencing methods, for genetic analysis by insertional mutagenesis, and alteration of gene expression. The invention is used to achieve efficient, simple, non-specific or random insertion into any given DNA segment. The present sequence is donor plasmid pEM delta R.adj to 1 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transposon for use in e.g. DNA sequencing methods, comprises a mutation that allows efficient and simple insertion of and reduced target site specificity on the transposon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TTTTGTCACTCTTCCCTAAATAATCCTTAAAAACTCCATTTCCACCCCTCCCAGTTCCCA

The present invention describes a process for the recombinant production of desired heterologous polypeptides (HP). The method comprises culturing a bacterial cell expressing a fusion protein (FP), comprising a colypeptide with autoproceolytic activity of autoprocease Npro and a HP, isolated and treated so that HP is cleaved autoprocease Npro and isolated and treated so that HP is cleaved autoproceolytically by Npro activity from FP. The method is useful for producing a heterologous polypeptide with a clearly defined homogeneous N-terminus in a bacterial, preferably Escherichia coli cell. HP includes enzymes, agents with pharmaceutical activity such as inerleukins, interferons such as leukocyte interferons, growth factors, in particular haemopoietic or wound-healing growth factors, such as granulocyte colony stimulating factor (GCSF), erythropoietin, hormones such as human growth hormone (HGH), antibodies or vaccines The present sequence represents the Nproches autoprotease and hGH is human growth hormone, which is used in an example
                                                                                                                                                                                  Producing heterologous polypeptide by culturing a bacterial cell expressing a fusion protein, comprising a polypeptide with autoproteolytic activity and a heterologous polypeptide, as an inclusion
                                                                                                                                                                                                                                                       Example 1; Page 15-17; 31pp; English.

The DNA sequence is that of the expression vector pmTNF-MPH which contains the tetracycline resistance gene and origin of replication of pATIS3, the lambda PL promoter up to the MboII site in the N gene 5' untranslated region, followed by a synthetic ribosome binding site and the information encoding the first 25 amino acids of mouse TNF. This sequence is followed by a synthetic polylinker encoding six consecutive histidines followed by several proteolytic sites each accessible via a different restriction enzyme which is unique for the plasmid. Downstream from the polylinker, several transcription terminators are present, including the E. coll trp terminator. The DNA encoding a fragment of including the E. coll trp terminator. The DNA encoding a fragment of the sypression vector to express the fusion protein mTNF-H6-p362. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /*tag= a

The polypeptide induced in macrophages by lipopolysaccharide stimulates cell prolification (esp. when costimulated with IL-4) promote activation, cytotoxicity, and mobilisation of LAK cells; promote activitation of suppressive peritoneal exudate cells; promote generation of immunocompetent lymph node cells (LNC) and have trypanocidal and trypanolytic activity. The human and murine sequences are given in (AAQ51843-45), peptide fragments able to generate antibodies are given in (AAR51951-61) (Updated on 25-MAR-2003 to

controlled of a mutant resistance gene. The method comprises providing a constraint of a mutant resistance gene. The method comprises providing a constraint of a mutant resistance gene is likely to evolve through two or more independent mutation events. Also disclosed are mutant resistance genes conferring polypeptides, and a method conferenting a drug for anti-pathogenic activity against a pathogen and assessing the potential longevity of a candidate anti-pathogenic drug. The mutant resistance gene includes two or more nucleic acid assessing the potential longevity of a candidate anti-pathogenic drug. The mutant resistance gene includes two or more nucleic acid configrations, which affects the expression levels of the encoded polypeptide. The mutanted resistance gene is inserted into a host cell cusing a plasmid and treating the host cell to incorporate the plasmid construct the host cell for screening for a drug for anti-pathogenic activity against a pathogen. The present sequence represents a plasmid construct used in the construct used in the construct used in the construct of the invention. Predicting the evolutionary potential of a mutant resistance gene, useful for screening for anti-pathogenic drugs comprises determining if a mutant resistance gene is likely to evolve through two or more independent mutation events. Disclosure; SEQ ID NO 1; 47pp; English WPI; 2004-313650/29 Hall

                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the DNA sequence of plasmid pACYCL84. The plasmid includes an origin of replication sequence, denoted p15A ori, positioned within an ExoRT-Hindill fragment corresponding to nuclectides 1-1523 of the present invention is based on the finding that the present sequence. The present invention is based on the finding that key mutations in the p15A ori sequence operatively linked within a comparation of the plasmid being converted from a low copy number to a high copy number plasmid useful for more efficient cloning, DNA and RNA purification, protein expression and co-expression. The mutated copy plasmids of the patric and be isolated and inserted into low copy plasmids other than pACYCL84 to convert them to high copy number plasmids. Preferred mutations to p15A locus of pACYCL84 by PCR, use of an amplified 1.5 kb product to construct a plasmid library, transformation of Escherichia coli BL21(DE3) cells and screening of transformation of Escherichia coli BL21(DE3) cells and screening of transformation that of pACYCL84. Sequencing of the BCORI. HindIII fragment of pECI-073 as other than that of pACYCL84. Sequencing of the BCORI. HindIII fragment of pECI-073 centered that of pACYCL84.

This GSS is part of a random genomic sequencing program of thirteen

yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces

exiguus. Saccharomyces servazzii, Zygosaccharomyces rouxii,

Saccharomyces kluyveri, Kluyveromyces thermocolerans, Kluyveromyces

lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia

angusta. Debaryomyces hansenii, var. hansenii, Pichia sorbitophila,

Candida tropicalis and Yarromia lipolytica. Genomic inserts of 3 to

5 kb were prepared and both extremities were sequenced. See

EcoRI; isolate: 2sp2 ; cDNA was prepared from polyA+
enriched RNA The cDNA was ligated into Lambda gill from
Stratagene and packaged using Gigapack packaging extracts.
An aliquot of the amplified library was used to transduce
E. coli Y1090 and phage DNA was purified from a liquid
lysate. The cDNA inserts were gel purified after EcoRI
digestion and ligated into pBluescript SK+. Aliquots of
the ligation were used to transform E. coli DHSalpha which
were plated onto medium with X-gal for selection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /tissue type="mycelia" /dev_stage="Young, actively growing mycelia (3 days after incollation) grown in liquid culture (cutin minimal medium containing 2%quose)." /lab_host="DHSalpha"

/clone_lib="lil8 - RescueMu Grid S"
/clone_lib="lil8 - RescueMu Grid S"
/note="Organ: leaf; Vector: RescueMu (engineered from
pBlueScript backbone); Site_1: BamHI; Site_2: BgIII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid S was grown at San Diego in 2002. DNA was
extracted from leaf strips, double digested using BamHI
and BgIII, and ligated to form circular plasmids. DH10B
cells were transformed and then screened on LB plates with
ampicillin."

Watanabe,M., Kobayashi,N., Shin-i,T., Horiike,T., Tateno,Y.,

Kohara; T. and Okada,N.

Extensive analysis of ORP sequences from two different cichlid

species in Lake Victoria provides molecular evidence for a recent
radiation event of the Victoria species flock: identity of EST

sequences between Haplochromis chilotes and Haplochromis sp.

Kohara,Y. and Okada,N.
Extensive analysis of ORF sequences from two different cichlid
species in Lake Victoria provides molecular evidence for a recent
radiation event of the Victoria species flock: identity of EST
sequences between Haplochromis chilotes and Haplochromis sp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    99

Extensive analysis of ORF sequences from two different cichlid

Species in Lake Victoria provides molecular evidence for a recent
radiation event of the Victoria species flock; identity of E&T

sequences between Haplochromis chilotes and Haplochromis sp.
